

A sweet comparison Between **BTC** & **ETH** During 2017 Market crash

Bitcoin

Touched high of 19666 on 17th Dec 2017

It was clear that Btc dominates the crypto market and reached peak well before Eth. Eth was still moving higher when Btc was falling after touching a peak of \$19.6K . We might see the same scenario again
It almost took a month more for Eth to touch the peak

Ethereum

Touched high of 1420 on 13 Jan 2018

Bitcoin

Touched a low of 5920 on 6th Feb 2018

Btc Price Found a low of 5920 on 6th Feb almost after 2 months of touching the peak whereas Eth took more than 2 months to found a new low of 362. Eth in comparison took more time

Ethereum

Touched a low of 362 on 30th Mar 2018

Bitcoin Dropped 70%

Ethereum Dropped 74%

We also noticed 3 down moves in both Btc and Eth however Eth dropped 3% more than btc in the first leg, 7% more in the second leg and in total it dropped 4% more than Btc

We are expecting price to break ATH this year . And expecting the same scenario to happen again Once btc hits new ATH and starts to consolidate we will move funds slowly from BTC to ETH and Then to other alt coins

We have noticed earlier as well that alt coins will pump right after btc starts to fall. However, keep in mind that most alt coins doesn't solve any real purpose, nor they have real use cases. Hence, we always recommend not to keep majority of the investment in alt coins. It can only be kept safe in BTC for long term
